Ethical Challenges,
Digital Branding, and
Digital Branding.

ABSTRACT

Purpose: The present study examines the dual-edged role of Artificial Intelligence (AI) in influencer marketing, with a focus on the Indian digital ecosystem. It seeks to understand how AI tools enhance campaign precision and ROI while simultaneously raising ethical concerns related to authenticity, data privacy, algorithmic bias, and deepfake misuse.

Design/Methodology/Approach: The study adopts a qualitative approach using literature review and stakeholder interviews involving influencers, marketers, and consumers. Case studies of brands such as Nykaa, Mamaearth, and H&M are analyzed to demonstrate the application of AI-based tools like sentiment analysis, chatbot-enabled engagement, and influencer platforms (e.g., Qoruz, HypeAuditor) in campaign planning and execution.

Findings: The findings reveal that while AI-driven influencer marketing enables greater personalization, efficiency, and campaign performance, it also tests ethical boundaries concerning influencer authenticity and consumer trust. The study proposes a Responsible AI Framework comprising transparency in influencer disclosures, ethical AI audits, and human oversight in campaign decisions.

Research Limitations: The study is limited to qualitative insights from selected Indian brands and stakeholders, which may restrict generalizability across diverse industries or geographies. Further research could extend the framework by incorporating quantitative measures of consumer trust and AI adoption across global markets.

Managerial Implications: For practitioners, the study underscores the need to balance efficiency with ethics in AI-enabled campaigns. Managers must adopt responsible AI practices to safeguard consumer trust, particularly among Gen Z audiences, who are highly tech-savvy and socially conscious.

Originality/Value: The study contributes to the limited literature on AI in influencer marketing within India, offering a practical ethical framework that integrates technology adoption with value-based digital trust. It highlights how brands can sustain long-term consumer engagement by aligning AI innovations with ethical considerations.

DOI: [10.51768/dbr.v26i2.262202503](https://doi.org/10.51768/dbr.v26i2.262202503)

Introduction

The fusion of Artificial Intelligence (AI) with influencer marketing has redefined the strategic contours of digital engagement. By automating tasks, enhancing precision in audience targeting, and optimizing campaign performance, AI now plays a pivotal role in how brands connect with consumers in the digital space.

AI-Driven Transformation in Influencer Marketing

The marketing industry benefits from AI technology, which provides predictive analytics and audience segmentation, and performance forecasting capabilities. Research conducted in recent times shows that big data analytics together with AI systems and influencer networks help brands create viral influencer campaigns through real-time data analysis and network-based effects (Theodorakopoulos et al., 2025). Research about influencer marketing from previous studies demonstrates that brands achieve better results through data-based and technological methods which help them pick better influencers and run more successful campaigns (Aw & Agnihotri, 2024). AI tools use machine learning and natural language processing, and data mining to analyze extensive social media content, which helps brands select influencers who match specific behavioral patterns and engagement records and target specific audience characteristics (Belanche et al., 2024). The strategic alignment through this method leads to better cost management and higher return on investment for influencer marketing campaigns.

Emergence of Virtual Influencers: A New Digital Frontier

Virtual influencers represent a transformative yet disputed outcome of AI implementation in this field because they are digital characters created through computer algorithms to function like human beings on social media platforms. The virtual influencer Lil Miquela from the USA and Kyra from India represent examples of digital characters that use computer-generated technology to mimic human behavior on social media platforms. Research conducted before this study shows that data analytics and artificial intelligence progress has made it possible for brands to develop virtual influencers which they can use for strategic

marketing purposes (Aziz et al., 2024). Virtual influencers enable brands to maintain complete control over their digital appearance and messaging, and behavioral consistency. The use of virtual influencers creates ethical problems because they enable deception and emotional control while making it difficult to distinguish between authentic and simulated experiences (Jin & Ryu, 2020). The emotional connection between consumers and marketing strategies makes these concerns particularly significant because trust remains essential for successful emotionally resonant marketing.

Ethical and Psychological Challenges of AI Mediation

The implementation of AI for content curation and sentiment analysis, and behavioral targeting has created multiple complex ethical problems that involve Data privacy and surveillance, Algorithmic bias and filter bubbles, and Opacity in decision-making processes. The established AI ethics frameworks support these concerns because they require systems to provide transparent operations while being accountable for their actions and maintaining fair treatment of all individuals and upholding human self-determination (Floridi et al., 2018). The situation becomes more critical in India because its emerging market depends on young audience members who use Instagram and YouTube, and Moj to watch influencer content. AI's wide influence on user content exposure creates doubts about how people maintain control over their digital lives and how they make informed purchasing decisions.

The Centrality of Human Trust and Emotional Relatability

The emotional aspects of influencer marketing, together with their relational elements, cannot be substituted by AI systems. The core elements of successful influencer-consumer relationships consist of trust, along with perceived authenticity and open communication. Research from the past few years shows that AI-created influencers create fake social signals yet people doubt their authenticity when they discover that these interactions result from machine operations instead of human involvement (Güzel, 2024). The emotional connection between consumers and influencers becomes less strong when AI mediation or virtual influencers without disclosure enter the content creation

process, which could harm marketing campaign success. Research shows that people tend to prioritize authenticity and personal connection over flawless technical execution (Kansra & Oberoi, 2022).

Research Aim and Relevance

The research investigates how AI-based operational efficiency interacts with ethical accountability within influencer marketing systems. The research examines how three AI-related factors, personalization, authenticity, and transparency, affect consumer trust in the Indian digital marketing environment. The research examines the Indian market because it represents a fast-expanding demographic with distinct cultural characteristics.

Literature Review

The convergence of Artificial Intelligence (AI) and influencer marketing has emerged as a transformative shift in digital branding strategies. The existing literature spans multiple dimensions, including personalization, consumer trust, perceived authenticity, and ethical implications of AI-generated content.

AI in Influencer Marketing

AI technologies serve multiple functions in influencer marketing by helping identify influencers and optimize campaigns, and measure their audience engagement. According to (Belanche et al., 2024), AI technology helps brands identify audience preferences, which enables them to select appropriate influencers for better campaign results and return on investment. AI tools that combine natural language processing with predictive analytics help brands evaluate influencer-brand compatibility while forecasting their campaign outcomes. The AI-based platforms HypeAuditor and Qoruz help brands lower their campaign risks through their analysis of influencer credibility and fake follower detection, and engagement performance metrics. Research indicates that influencer marketing success requires influencers to create genuine brand connections through their perceived authenticity and relationship-building abilities in addition to traditional metrics of reach and analytics (Okonkwo & Namkoisse, 2023). The process of automated influencer selection through AI systems could potentially damage the emotional

aspects that remain vital for consumer-influencer bond development (Jin & Ryu, 2020).

Perceived Authenticity and Consumer Response

The fundamental power of influencers stems from their authentic nature. People trust content that presents honest experiences and authentic opinions, and genuine values. AI-generated influencers together with heavily edited content tend to create artificial impressions that deceive audiences (Kansra & Oberoi, 2022). Research shows that AI content optimization leads to better relevance, but it makes messages seem less authentic to audiences. (Jin & Ryu, 2020) analyze how synthetic influencers such as Lil Miquela and Kyra create a contradictory effect by drawing interest yet producing doubt because their artificial nature lacks human emotions. Research about AI content generation shows that AI-generated content with algorithmic optimization improves message relevance and brand communication scalability but makes consumers perceive messages as less authentic and less emotionally resonant (Raut et al., 2024). The ongoing debate in AI marketing research focuses on the conflict between achieving operational efficiency and maintaining emotional connection with audiences.

Transparency and Ethical Use of AI

The maintenance of consumer trust depends heavily on making AI operations transparent to users. (Jain & Kumar, 2024) state that AI tools and avatars need to receive proper disclosure during marketing campaigns. Digital natives who value privacy strongly tend to view hidden operations as manipulative because they lack transparency. Research conducted in recent times about ChatGPT and other generative AI tools used in influencer marketing demonstrates that brands must reveal their AI usage to protect their credibility and build trust with customers and maintain ethical marketing standards (Saini et al., 2024). New ethical frameworks have started to develop solutions for stopping data exploitation and algorithmic prejudice, and deepfake deception. The implementation of ethical AI principles, which include explainability and accountability, and inclusiveness, should become standard practice for AI marketing operations according to (Belanche et al., 2024) and (Jain & Kumar, 2024).

Consumer Trust and Digital Influence

The three components of consumer trust include content credibility and influencer relatability, and brand consistency. The research by (Kansra & Oberoi, 2022) demonstrates that AI-based personalization systems build trust through better content matching, yet this effect requires organizations to follow ethical data handling procedures. Research studies have shown that AI-powered analytics in influencer marketing create better consumer trust and brand loyalty through its ability to deliver appropriate brand-influencer interactions at the right time (Samanta et al., 2025). The practice of over-personalization leads to privacy-related issues and emotional distress for users. The Indian social environment, where influencer culture thrives on community development and aspirational identity, makes trust function as both a social and emotional construct. AI tools need to achieve optimal results while maintaining the essential human element, which makes influencers successful.

Research Gap

While global literature has explored virtual influencers and algorithmic marketing, limited empirical studies have examined how Indian consumers perceive AI's role in influencer campaigns. There is also a lack of integrative models analyzing the combined effect of personalization, authenticity, and transparency on trust. This study addresses this gap using a structured regression model grounded in Indian consumer behavior.

Research Objectives

This study is guided by the following objectives:

1. To assess the impact of perceived personalization on consumer trust in AI-based influencer marketing.
2. To assess the impact of perceived authenticity on consumer trust in AI-based influencer marketing.
3. To assess the impact of transparency on consumer trust in AI-based influencer marketing.
4. To determine the combined influence of these variables on consumer trust in AI-based influencer marketing.

Methodology

Research Design and Approach

This study adopts a quantitative, empirical research design to explore how AI-enabled features in influencer marketing impact consumer trust. A structured, survey-based approach was employed to collect standardized responses across a demographically diverse group of digitally active users. The primary goal was to statistically evaluate the effect of three independent variables- Perceived Personalization, Perceived Authenticity, and Transparency of AI Use- on the dependent variable, Consumer Trust in influencer marketing. The analysis was conducted using IBM SPSS Statistics 27 to perform multiple linear regression, emulating SPSS-style outputs to ensure replicability and statistical rigor.

Population and Sampling Strategy

The research focused on Indian people between 18 and 35 years old who lived in Tier-1 and Tier-2 cities, including Delhi, Mumbai, Bengaluru, Pune, Jaipur, and Lucknow. The researchers chose these cities because they have high internet access and active social media engagement, and they were among the first to adopt AI-based technologies. The researchers selected this age range because Gen Z and Millennials, who lead influencer marketing trends, are part of this demographic.

The research employed snowball sampling to start with participants from academic and professional networks, who then brought in additional suitable respondents. The research method enabled researchers to build an expanding pool of participants who shared similar characteristics. The research team obtained 200 usable responses for statistical evaluation.

Instrumentation and Measurement Scales

Data were gathered using a structured online questionnaire consisting of four multi-item scales aligned with the study's conceptual framework:

- Perceived Personalization (e.g., "The content I see from influencers is tailored to my preferences")

- Perceived Authenticity (e.g., “Influencers I follow appear genuine and sincere”)
- Transparency of AI Use (e.g., “I am aware when AI tools are used in influencer recommendations”)
- Consumer Trust (e.g., “I trust influencers who use AI-driven personalization ethically”)

Each construct included three items, adapted from validated scales in prior literature and customized for the Indian context. Responses were recorded on a 5-point Likert scale, ranging from 1 (Strongly Disagree) to 5 (Strongly Agree), to measure varying degrees of consumer perception.

Hypothesis

The following hypotheses have been proposed for the study:

H01: Perceived personalization does not have a significant impact on consumer trust in AI-based influencer marketing.

H02: Perceived authenticity does not have a significant impact on consumer trust in AI-based influencer marketing.

H01: Transparency does not have a significant impact on consumer trust in AI-based influencer marketing.

Data Analysis Technique

The dataset was analyzed using IBM SPSS Statistics 27 outputs. Key analysis steps included:

- Descriptive statistics for demographic profiling
- Reliability testing using Cronbach’s Alpha to ensure internal consistency ($\alpha = 0.835$)
- Multiple linear regression to assess the direction and strength of the relationships between the three predictors and consumer trust
- Model diagnostics included Adjusted R^2 (0.735), F-statistic (184.746), and Standard Error (0.18677) to evaluate the model’s explanatory power and predictive efficiency.
- The coefficients table revealed that Perceived Personalization ($B = 0.411$) had the strongest

effect on Consumer Trust, followed by Perceived Authenticity ($B = 0.335$) and Transparency ($B = 0.295$), all statistically significant at the 0.001 level.

These analyses confirmed that the model was statistically robust and explained 73.9% of the variance in consumer trust.

Ethical Considerations

The research was conducted all accordance with established ethical research protocols. All participants joined the study voluntarily while receiving complete details about research objectives and data handling procedures, and their freedom to leave the study at anytime. The research collected no information that could identify individual participants. The research protected participant confidentiality and data privacy while following all necessary human-subject research protocols for academic studies.

Analysis and Interpretation

The analysis of the dataset was conducted using multiple linear regression to assess the relationship between the three independent variables, perceived personalization, perceived authenticity, and transparency of AI use, and the dependent variable, consumer trust in influencer marketing. The results were generated using IBM SPSS Statistics 27 output.

Demographic Analysis

Table No. 1 presents the demographic profile of respondents in terms of age, gender, and occupation. The sample is largely young and digitally active, with a near-balanced gender distribution and diverse occupational backgrounds, making it relevant for influencer marketing research.

The demographic distribution shows equal numbers across all important segments. The 24-29 age range represents the biggest segment of participants at 37% while 18-23 years old make up 35.5% of the total sample population. The gender distribution shows a balanced split between female and male participants at 49% and 42% while 9% of participants chose other or did not specify their gender. The study population consists mainly of students at 31% followed by business owners at 25% and others at 23.5% and professionals at

Table No. 1: Frequency Table: Age, Gender, and Occupation

Variable	Category	Frequency	Percent	Valid Percent	Cumulative Percent
Age	18-23	71	35.50%	35.50%	35.50%
	24-29	74	37.00%	37.00%	72.50%
	30-35	55	27.50%	27.50%	100.00%
Gender	Male	84	42.00%	42.00%	42.00%
	Female	98	49.00%	49.00%	91.00%
	Other/Unstated	18	9.00%	9.00%	100.00%
Occupation	Student	62	31.00%	31.00%	31.00%
	Professional	41	20.50%	20.50%	51.50%
	Business Owner	50	25.00%	25.00%	76.50%
	Others	47	23.50%	23.50%	100.00%

Source: Primary Data

20.5%. The study population consists of digitally active young participants who represent diverse backgrounds, making them suitable for Indian influencer marketing research.

provides a nuanced understanding of engagement intensity, which is essential for tailoring AI-enabled influencer marketing strategies to specific audience segments.

Cross Tabulation Analysis

Table No. 2 presents the cross-tabulation of demographic variables with levels of engagement with influencers. The analysis highlights variations across age, gender, and occupation, offering insights into how different demographic groups interact with influencer content. This comparison

The cross-tabulation reveals essential demographic characteristics of influencer engagement patterns. The 24-29 age group demonstrates the highest level of interaction, with the 18-23 age group following close behind. Female participants interact more often and daily than male participants, and users who identify as Other/Unstated show average levels

Table No. 2: Crosstabulation: Demographics Vs. Engagement with Influencers

Variable	Category	Rarely	Occasionally	Frequently	Daily	Total
Age	18-23	8	27	22	14	71
	24-29	4	25	30	15	74
	30-35	4	19	21	11	55
Gender	Male	6	33	28	17	84
	Female	9	30	37	22	98
	Other/Unstated	1	8	8	1	18
Occupation	Student	3	21	25	13	62
	Professional	5	13	17	6	41
	Business Owner	3	20	19	8	50
	Others	5	17	12	13	47
Total		16	71	73	40	200

Source: Primary Data

of activity. Students lead all occupations in terms of engagement, yet business owners and professionals also demonstrate significant interaction. The most active user groups for AI-enabled influencer marketing strategies consist of young adults and female users, and students.

Table No. 3 presents the cross-tabulation of demographic characteristics with respondents' willingness to follow AI-generated influencers. The analysis highlights how age, gender, and occupation shape openness toward virtual influencers, offering valuable insights for identifying target groups in AI-driven marketing campaigns.

The crosstab analysis reveals that people aged 18-29 make up 80% of all "Yes" responses when it comes to following AI-generated influencers. The data shows that female participants (31) outnumber male participants (27) who follow virtual influencers, yet "Other" respondents remain uncertain about their choices. The data shows students (22) and business owners (15) demonstrate the greatest willingness to follow AI influencers, but

professionals show the least interest. The data shows that virtual influencer campaigns should focus on targeting young people and students, and female audiences, because they show the highest interest in AI-generated content.

Reliability Analysis

Table No. 4 presents the reliability analysis of the measurement scale. Reliability is important as it ensures consistency and accuracy of the items in measuring the intended constructs.

To assess the internal consistency of the measurement scale used in the study, a reliability analysis was conducted on all 12 items corresponding to the four key constructs: Perceived Personalization (PP1-PP3), Perceived Authenticity (PA1-PA3), Transparency (TR1-TR3), and Consumer Trust (CT1-CT3). The Case Processing Summary indicates that all 200 responses (100%) were valid and included in the analysis, with no exclusions due to missing data, ensuring complete data integrity. The results of the Reliability Statistics show a Cronbach's Alpha of 0.835, which exceeds the

Table No. 3: Crosstabulation: Demographics Vs. Follows AI-Generated Influencers

Variable	Category	Yes	No	Not Sure	Total
Age	18-23	23	37	11	71
	24-29	26	35	13	74
	30-35	12	31	12	55
Gender	Male	27	40	17	84
	Female	31	51	16	98
	Other/Unstated	3	12	3	18
Occupation	Student	22	28	12	62
	Professional	10	27	4	41
	Business Owner	15	24	11	50
	Others	14	24	9	47

Table No. 4: Reliability Analysis

Cronbach's Alpha	N of Items
0.835	12

Source: Primary Data

acceptable threshold of 0.70, confirming a high level of internal consistency among the items. This suggests that the survey instrument reliably measures the intended latent constructs and that the items are well-aligned in capturing consumers' perceptions related to AI-driven influencer marketing.

Model Summary Table

Table No. 5 presents the model summary of the regression analysis. It provides key model fit indicators such as R, R², Adjusted R², and Standard Error of the Estimate, which assess the strength, explanatory power, and predictive accuracy of the model.

The model summary showed an R value of 0.860, which demonstrated a strong positive relationship between the predictor variables transparency and perceived personalization, perceived authenticity, and the dependent variable consumer trust. The R² value of 0.739 indicates that the three predictors explain 73.9% of consumer trust variance, which demonstrates the model's strong ability to explain behavioral and marketing phenomena. The Adjusted R² value of 0.735 confirms the model's generalizability because it shows the predictive power remains consistent after accounting for the number of independent variables. The Standard Error of the Estimate (0.18677) indicates that the model produces accurate predictions because observed values match predicted trust scores with high precision. The model demonstrates a strong ability to identify essential factors that influence consumer trust in AI-driven influencer marketing, according to these results.

ANOVA Table

Table No. 6 presents the ANOVA results of the regression model. It evaluates the overall statistical significance of the predictors, confirming whether transparency, perceived personalization, and perceived authenticity collectively explain variation in consumer trust.

The Analysis of Variance (ANOVA) results show that the regression model effectively predicts consumer trust through its overall statistical significance. The F-statistic reaches 184.746 with a p-value below 0.001, which proves the regression model's strong statistical significance. The results show that one or more of the transparency and perceived personalization, and perceived authenticity variables significantly influence consumer trust levels. The model explains 26.169 of the total variation through its regression sum of squares, which equals 19.332, and its residual sum of squares equals 6.837. The model demonstrates high predictive efficiency because the mean square for regression equals 6.444 and the mean square for residuals equals 0.035 with 3 degrees of freedom for regression and 196 degrees of freedom for residuals. The ANOVA results demonstrate that the regression model provides reliable and effective explanations for AI-driven influencer marketing phenomena.

Coefficients Table

Table No. 7 presents the regression coefficients of the predictor variables. It highlights the individual contribution of perceived personalization, perceived authenticity, and transparency in explaining varia-

Table No. 5: Model Summary Table

Perceived_Personalization	0.411	0.024	0.625	17.084	0
Perceived_Authenticity	0.335	0.025	0.486	13.286	0
Transparency	0.295	0.025	0.424	11.577	0

Source: Primary Data

tions in consumer trust within AI-enabled influencer marketing.

The regression coefficients show how each predictor variable affects consumer trust in AI-enabled influencer marketing independently. The unstandardized coefficient for personalization shows a 0.411 unit increase in consumer trust for every one-unit increase in personalization while controlling for other variables ($p < 0.001$). The model shows personalization as its most influential factor because it has the highest standardized beta value of 0.625. The coefficient for perceived authenticity measures 0.335, and its beta value reaches 0.486 ($p < 0.001$), which demonstrates that authentic communication remains vital even when using AI systems. The coefficient for transparency equals 0.295, and its beta value equals 0.424 ($p < 0.001$), which shows that AI usage disclosure leads to increased consumer trust and confidence. The

constant term ($B = 0.021, p = 0.908$) shows no statistical significance, which indicates that predictors determine the baseline consumer trust level remains minimal. The three independent variables, personalization, authenticity, and transparency, demonstrated positive effects on consumer trust because all proposed study hypotheses received statistical support. The study results demonstrate that personalization, authenticity, and transparency create substantial positive effects on consumer trust when used in AI-based influencer marketing.

The Path Diagram

Figure No. 1 presents the path diagram derived from the multiple regression analysis. It depicts the direct effects of perceived personalization, perceived authenticity, and transparency on consumer trust, highlighting the strength and direction of these relationships.

Figure No. 1: Path Diagram

Source: Primary Data

The multiple regression analysis results from this study appear in the path diagram, which provides a visual representation. The diagram shows how Perceived Personalization ($B = 0.411$) and Perceived Authenticity ($B = 0.335$), and Transparency of AI Use ($B = 0.295$) directly affect Consumer Trust in influencer marketing. The analysis shows that AI-driven customization, which matches user preferences, creates the strongest positive effect on trust ($B = 0.411$). The positive effect of Perceived Authenticity ($B = 0.335$) demonstrates that consumers trust influencer content more when it appears authentic, even when AI algorithms create it. The variable Transparency of AI Use demonstrates a significant impact ($B = 0.295$) because disclosing AI usage leads to better ethical perceptions and increased trust. The diagram shows both the strength and direction of the relationships through its directional arrows. The positive coefficients demonstrate that each predictor variable creates a positive effect on consumer trust, which supports the need to unite AI operational efficiency with authentic and transparent influencer marketing approaches.

Conclusion

The research results demonstrate that Artificial Intelligence (AI) functions as a technological tool that enables influencer marketing operations and serves as an ethical boundary for the industry. The multiple regression analysis shows that consumer trust increases when AI tools deliver personalized content while being authentic and transparent about their usage. The study shows that personalization through AI tools ($B = 0.411$) creates the strongest impact on consumer trust because customized content based on individual preferences leads to higher trust in influencer marketing campaigns.

AI technology provides dual benefits to marketing operations by maximizing audience contact and creating personalized content that delivers genuine value to individual customers. The study shows that authenticity ($B = 0.335$) maintains its essential value because people trust influencers who show genuine emotions even when technology stands between them. The study demonstrates that AI use disclosure through transparency ($B = 0.295$) builds ethical brand perception and increases credibility.

The research results confirm previous studies, which demonstrate that AI should function as an assistance tool for human marketing communication professionals (Jin & Ryu, 2020); (Kansra & Oberoi, 2022). The research supports the need for ethical management systems to oversee virtual influencer operations and automated content delivery methods. The research of (Belanche et al., 2024) and (Jain & Kumar, 2024) demonstrates that trust and transparency remain vital for maintaining consumer relationships in modern automated systems.

The research supports the strategic value of responsible AI implementation in India because digital engagement continues to expand among Gen Z and millennials. Brands that show transparency about their AI usage in influencer discovery and campaign management will establish stronger long-term relationships with digital-first consumers. The strategic future of marketing depends on how companies handle the connection between artificial intelligence and ethical practices and consumer trust. The implementation of responsible AI systems in influencer marketing creates essential value for both regulatory compliance and building strong emotional brand relationships with customers in our data-oriented world.

Recommendations

Based on the findings of this study and in alignment with emerging global standards on ethical AI deployment, the following strategic recommendations are proposed for brands seeking to strengthen consumer trust through AI-enabled influencer marketing:

1. *Mandate AI Disclosure for Transparency:* Given the significant influence of transparency ($B = 0.295$) on consumer trust, brands should implement a policy of mandatory disclosure whenever AI tools, algorithms, or virtual influencers are involved in marketing campaigns. Clear disclaimers such as “AI-generated content” or “influencer selected using AI” can reduce consumer skepticism and foster ethical clarity, especially as regulatory frameworks evolve (Oliveira-Castro & Marques, 2017).

2. *Establish Ethical AI Governance Frameworks:* Organizations need to establish official governance systems for their AI operations to preserve customer trust. The organization should perform

algorithm audits and bias tests and maintain documentation about data handling methods used in influencer profiling and audience targeting. The combination of legal and marketing, and data science teams working together will help organizations control risks and maintain ethical AI standards (Veale et al., 2018).

3. Balance Personalization with Privacy: The most influential factor for building trust in brands is perceived personalization, which reaches a value of $B = 0.411$. Brands need to develop personalization methods that respect consumer privacy through anonymized data collection and opt-in options, and complete GDPR and PDPB regulatory compliance. The use of hyper-targeted content must protect data privacy while delivering personalized experiences that meet customer needs without creating feelings of intrusiveness (Kapoor et al., 2018).

4. Blend AI Efficiency with Human Authenticity: Brands should use authenticity ($B = 0.335$) as a key factor to enhance their AI-based targeting methods through authentic influencer storytelling. The process of content curation through AI requires influencers to work together with brands to create messages that maintain emotional connections with their audience. The combination of ethical content training for influencers with their involvement in campaign narrative development creates a link between artificial intelligence systems and human emotional connection.

5. Educate Consumers to Foster Trust: AI system acceptance by consumers grows when users gain knowledge about their operational methods. Companies should create educational content that includes behind-the-scenes videos and algorithm explainers, and interactive tools to help customers understand AI operations. The practice of showing AI system operations leads users to believe the system operates fairly and makes them feel more in control of their experience (Belanche et al., 2024).

Limitations of the Study

The research provides essential information about AI usage in influencer marketing, but researchers need to recognize specific study restrictions. The research design with 200 participants from Tier-1 and Tier-2 Indian cities restricts the ability to apply study results to other locations. The research focused on three variables, yet other elements,

including algorithmic bias understanding and data protection issues, and cultural background differences, might influence consumer trust in AI-based influencer marketing. The study focused on the Indian digital environment but failed to evaluate how different cultural groups perceive AI systems and trust them.

Future Areas of Research

Future research can pursue multiple directions for the expansion of this study. Research studies can perform cross-country analyses to understand how cultural factors and regulatory systems influence consumer trust in AI-powered influencer marketing. Research designs that span multiple time periods will enable scientists to monitor how consumer opinions about AI influencers transform as technology advances. The model requires additional variables for future research, which can include perceived risk and consumer literacy, and ethical AI awareness as mediating or moderating factors. The research can include participants from different age groups and professional backgrounds to achieve a more comprehensive understanding of the Indian market. The study can combine qualitative research methods, including focus groups and ethnographic studies, to uncover the emotional and ethical aspects of consumer-AI interactions.
